TEXT EDITOR

DevPad

Presented by Himanshu Aggarwal

PROBLEM STATEMENT

Text Editors now-a-days comes with power packed features but forget to focus on the basic functionalities.

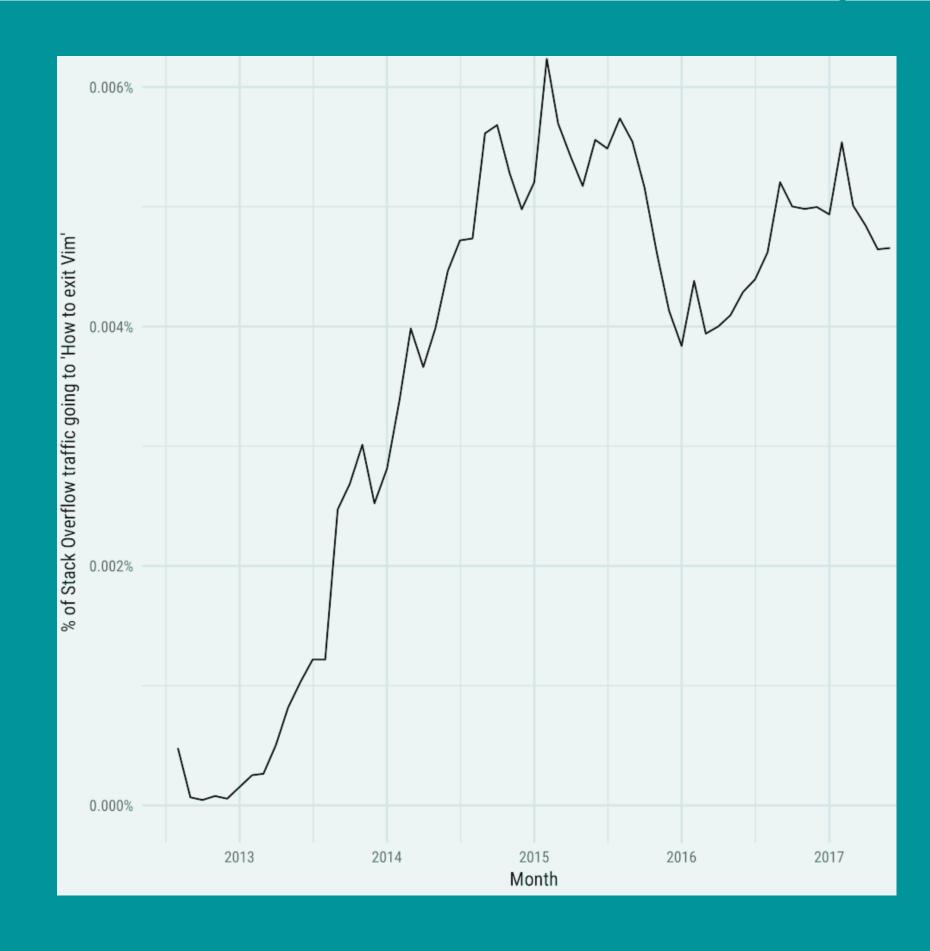

Also due to bunch of features they have complicated user interface.

SURVEY

ACCORDING TO A SURVEY EXITING VIM EDITOR IN LINUX MACHINE IS A BURDEN SOME TASK FOR MANY DEVELOPERS

HERE IS THE GRAPH REPRESENTING
THE SEARCH RESULT OF THE
POPULAR SITE STACK OVERFLOW
FOR THE QUESTION "HOW TO EXIT
VIM ?"

Solution

- Instead of complaining i myself addressed the problem and tried to develop a simple text-editor.
- DevPad is specially for those who needs some basic features like creating a file, editing a file etc.
- I took care of the User Interface and tried to implement as user friendly as i can.

How i implemented Algorithm:

- It is majorly focused on the File System Architecture.
- Reading/ Writing/ Appending
 all the operations handled via file system
- Feature like Spell Checking is the burdensome task to me, there are many options to Implement a spell check but the performance is the issue

Options i have:

- Linear Search
- Binary Search
- Hash Maps
- Tries

ARCHITECTU RE OF DEVPAD

What i choosed?

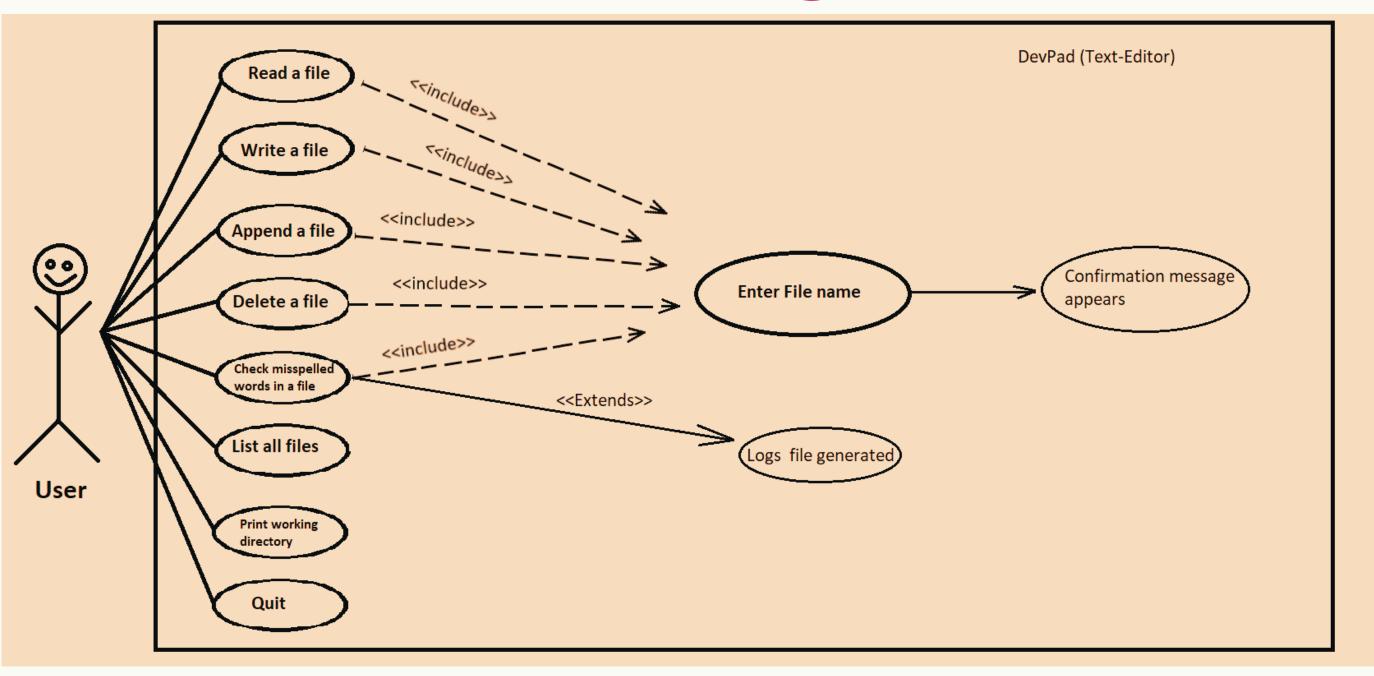

- I have chosen Tries as data structures, it is very efficient in terms searching a word, etc.
- It also provides us to efficiently implement auto-suggest feature which is in my To-Do list.

How it works?

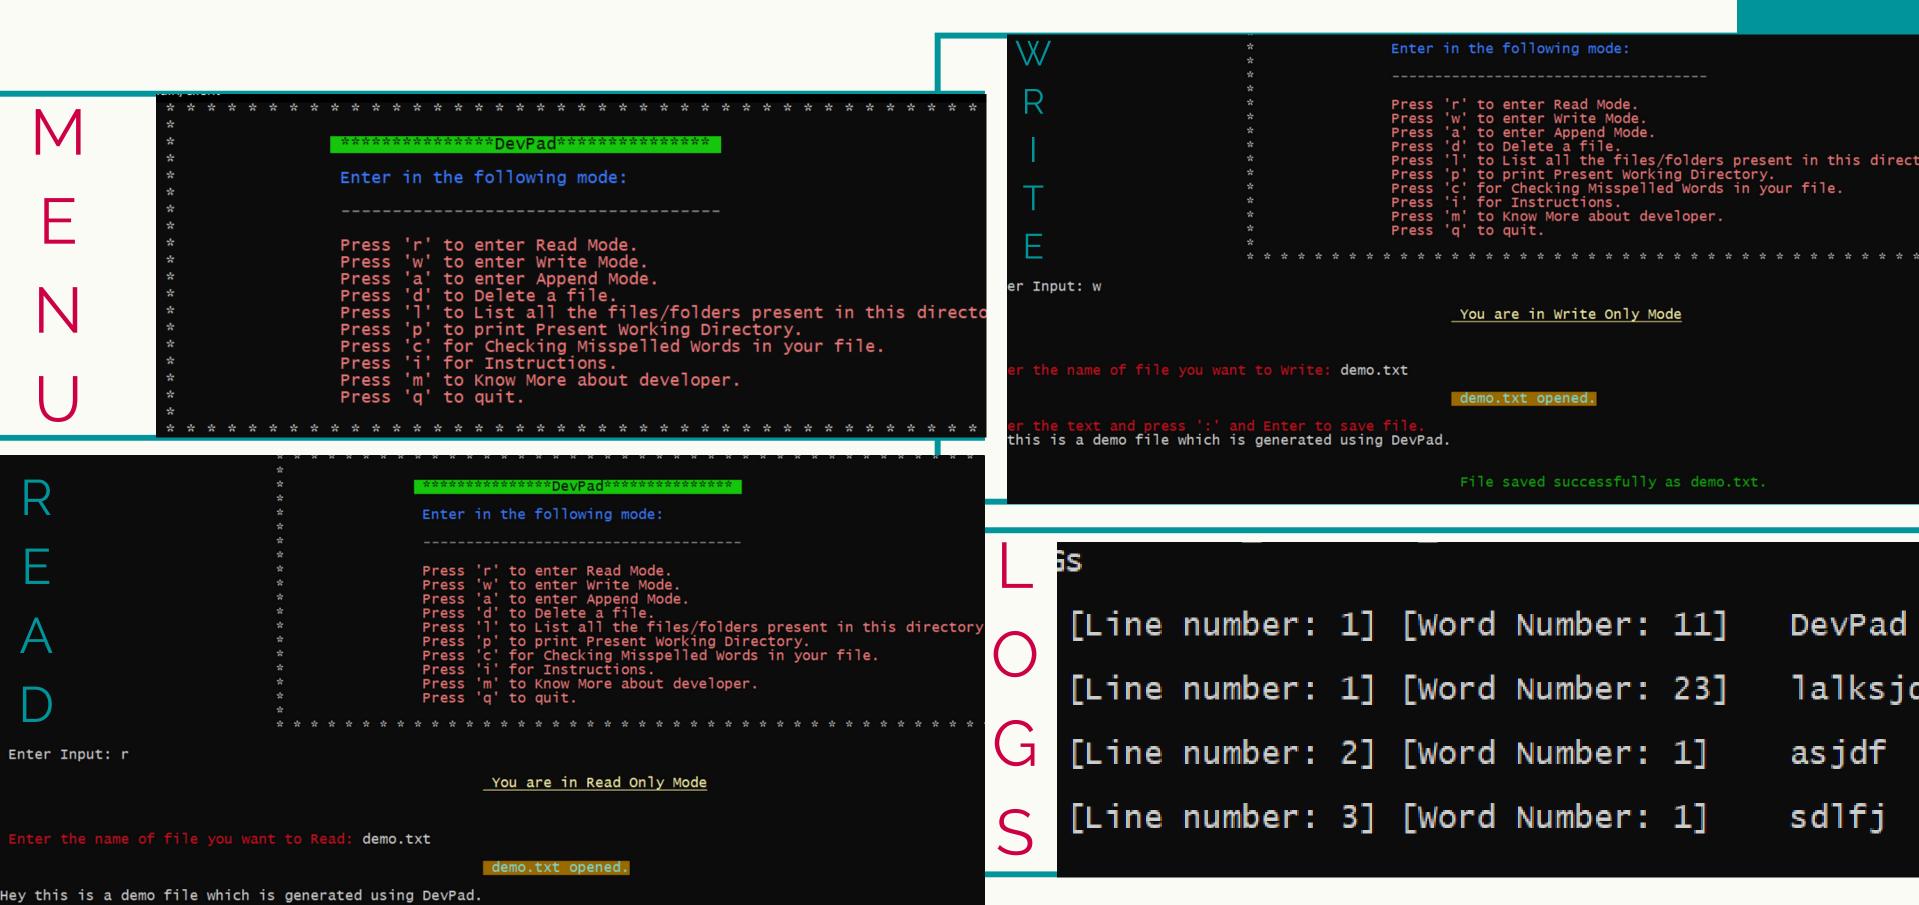

Using Devpad is very simple and self explainable, user can understand just by viewing them.

- When we run DevPad a Menu Screen appears, which shows all the option available .
- After taking the user input choice it asks for the further details, like name of the file you want to operate on.
- When user finishes its task a confirmation message box appears telling whether the task is completed or not.
